

FDA launches new website for medtech export documents

Mass Device

The FDA launches the Export Certification & Tracking System, allowing applicants to submit export document requests electronically.

The FDA's Center for Devices & Radiological Health launched its Export Certification & Tracking System, a new website for submitting and processing export document requests electronically, an alternative to paper submissions.

The system could reduce the certificate processing time and allow the applicants to see real-time status updates online, but it is only currently available for certificates to foreign governments, which account for 95% of all export certificate requests, [the FDA noted.](#) [1]
