

SafeCode Drug Technologies to Hire Project Manager to Market FDA Approved Painless Injection Device

The Associated Press

SafeCode Drug Technologies Corp. (OTCBB: SAFC), a developer of technologies that reduces errors and eliminates pain during the administration of prescription medications, announced today that the company intends to hire a Project Manager to oversee and implement a marketing strategy to commercialize its newly acquired painless injection device.

The company's new technology is fully approved by the Federal Drug Administration (FDA), and has demonstrated itself to be safe and effective in actively reducing pain during the administration of blood tests, lanching and injections - a daily reality for many during ongoing medical care.

Both EZject and Quickool - the newly acquired technologies - received FDA approval for commercialization in 2007.

"To acquire technology that already has FDA approval, is a major step toward full commercialization in the United States," said Akiva Schonfled, Chief Executive Officer of SafeCode Drug Technologies.

"These technologies have applications in hospitals, doctor's offices and clinics, in addition to the at-home, individual care markets. We are confident that with the right project manager in place, we can implement a winning commercialization strategy." About SafeCode Drug Technologies SafeCode Drug Technologies is the developer of patent-pending technologies that reduce errors and eliminate pain during the administration of prescription medications. The company's initial technology is voice-activated administration technology that ensures the proper medication is administered to the proper patient. The company's newly acquired EZject technology eliminates pain during blood tests and injections.
