

Color Coded Fittings

Color coding is simply coloring the fitting to the desired color for the application. The company can color code any of its Premium Grade Nylon and Commercial Grade Nylon Fittings, including: "Y" fittings, tees, connectors, luer fittings, tube to port fittings, compression fittings, and more. Color coding does not affect the functionality of the part, nor does it distort any of the part's dimensions. Color coded nylon fittings can easily identify water or air fittings in industrial applications, as well as "In" or "Out," or designate high and low pressure.
