

Benchtop Dispenser

The Ultra#153 2800 DispensLink#153 system uses positive displacement technology to produce consistent, volumetric shots of epoxies, adhesives, and many other assembly fluids#151regardless of changes in fluid volume, viscosity, or temperature. It is a mechanical benchtop system that operates on electricity and does not require the use of compressed air. It is ideal for applications that require precise metering of assembly fluids with changing viscosities, or where specific flow rates are necessary.
