

Pinch Valve

In response to critical performance needs for immediate position feedback sensing and quieter operation, the company offers two high purity liquid transfer pinch valve enhancement options that enable OEMs to expand and upgrade their product lines by offering specialized position feedback sensors and noise deadening features. The valves are intended for use in a variety of medical device applications. Position feedback is assured with a compact, factory-mounted, infrared optical sensor that instantaneously detects the position of the pinch valve pusher/armature assembly. The noise reduction option reduces the characteristic intermittent sound associated with the solenoid actuated pinch valve.
