

Touchscreen TFT Displays

HERCULES Medical Monitor series displays are high performance medical TFT monitors, featuring a fanless, custom-designed aluminum housing that provides completely-sealed IP65 protection. This water-tight construction means the display can be disinfected and washed down¹making it ideal for operating theaters, recovery rooms, and radiology. Through a VGA connector, the monitors can be connected to either a standard PC or the Hercules Medical PC. Optionally, they can be used in dual-display mode, extending performance and potential applications. The front glass is anti-reflection coated, and image zoom and shrink capability is provided independently for horizontal and vertical scales. Touch-panel heating is also available.
