

Marking System

The Kwikmark system is available with a 12 in. x 4 in. marking field and a programmable Z-axis. This design streamlines marking into deep cavities and recesses and is ideal for multiple level marking. Because it is a file based system, there are no limitations to characters per line, lines per file, character height, or file size. The system is capable of marking over 10 characters per second in straight, angular, or arc text modes. A powerful dual memory processing system features a compact flash card for file storage and requires no PC or external control box for operation.
