

Tubing/Extrusion Sets

Extrusion set capabilities range from micro to large bore sizes with co-extruded tubing available. A broad range of materials and thermoplastic resins are available for device design including non-DEHP PVC tubing. For customers who require durable containers with extremely low gas transmission rates and no leaching, PVC alternatives are also offered. Through the Customization by Design program, companies are offered over 2,000 standard component/set designs, designs in 24 hours, and delivery in as quickly as three weeks. In addition, custom component designs are available.
