

Cameras (2707)

These two intelligent color camera models are designed for in-line industrial vision applications. The Impact T28 and Impact T24 are the latest additions to the Impact T-series's intelligent cameras with full-scale vision image processing capabilities built into the camera. With a 1,600 X 1,200 pixel resolution, the T28 is ideal for high-accuracy color verification, label inspection, and real-time part sorting. The T24 is an economical color camera designed for high speed applications requiring lower resolution imaging (1024 X 768 pixels). Containing an on-board image processor plus real-time I/O and ethernet communications, both products are designed for 100 percent quality verification.
