

Subminiature Connectors

The Grommet D range of D-subminiature connectors are a cost effective and high-density rectangular connector system equipped for the most extreme environmental conditions. Superior sealing is provided by silicone rear grommets and interfacial sealing, equipping the connector to operate reliably even when immersed in water or corrosive liquids. A unique fluorosilicone grommet seals all the wire leads entering the rear of the connector while the interfacial seal ensures there is no possibility of leakage between the mated plug and receptacle. Stainless steel shells are optional, providing excellent resistance against corrosion.
