

# Temporary Masking Resin

The SpeedMask 7100 series of temporary metal masking resins offer reliable surface protection for orthopedic implants, implant hardware, surgical instruments, and medical devices. These masking resins cure in seconds using UV light. Multiple viscosity ranges simplify dispensing and reduce mask application to a single coat process. This line of UV curing products offers a range of adhesion levels to assure uncompromised protection and ease of removal. The resins leave no toxic residue on surfaces. Biocompatible grades are available.
