

## Modular Conveyor System

The VarioFlow workpiece pallet system is designed for linking machine tools and manual workstations, as well as supplying parts to assembly process stations. It can be used for products up to 8 kg in weight and speeds up to 18 meters per minute. The system is highly economical, requiring only one drive in many applications even over long conveyor segments, including those with curved sections. The pre-engineered system ensures proper fit and finish for all modular components, which simplifies system layout and speeds implementation. To provide the best possible surface for product transport, workpiece pallets are available in custom lengths of between 80 and 500 mm.
