

Electric Injection Molding Machine (3159)

The MEtII series all-electric injection molding machine further responds to demands for high precision, high cycle molding. As in its predecessor, the MEt, a variety of durable construction features enhance the precision of the MEtII Series. Its ultra-rigid frame suppresses vibration and holds accuracy to micron levels, while a highly rigid clamping mechanism and double-roller supported movable die plates further promote accuracy. To prevent tiebar load imbalance during mold opening/closing operation, two nozzle-touch ball screws connect the MEtII's injection and clamping units.
