

Laser Processing

The laser processing of PEEK and Hytrel tubing is available. This offering is in addition to the company's established ability to process another hard polymer, polyimide, and compliments its processing of soft polymers such as Pellethane and Pebax. The tube processing methods employ the programmable combination of laser energy and multi-axis automation to produce clean precise machined features. Machined features range from subtle tapers and stepped regions to dramatic hole-patterns to skived areas.
