

Double Torque Motor

The SM2315DT SmartMotor features an 8-pole compact rotor design with higher copper filling factor compared to conventional techniques and the design achieves a higher energy density as well as better efficiency that results in more torque capacity in the same physical package size. It can generate two times more continuous torque than the SM2315D. The OEM Series SmartMotor is a complete motion control system that is known for being compact, user friendly, and cost effective. Using a patented design, SmartMotors incorporate a servo motor, amplifier, and motion controller into the same integral frame.
