

Air-Blasting Machines

Indexing air-blast machines add quality and performance to medical devices, including joint replacements, nails and rods, surgical equipment and medical accessories, by altering the characteristics of their surfaces. These versatile air-blast systems perform operations ranging from shot peening for improved strength to surface profiling for better adhesions between bone, tissue, coatings, and implant surfaces. Because they are easily adapted to specialized applications, these automated systems boost production and improve repeatability with a minimum of custom engineering.
