

## Filling Machine

This filling system, designed for both aseptic and non-aseptic filling of flexible containers of any size, is comprised of an automated filling machine and cap interface. This novel cap design, in a single port, offers both filling and dispensing actions. A simple injection site is the end result for interface with syringe or general spike, and is compatible with any fluid administration set. This system is the company's answer to the growing industry need for the economical filling of flexible containers.
