

Swab Applicator

A large surface area applicator tip is available for the company's plastic ampoule. The tip is a molded plastic component with a specially designed foam applicator adhered to the plastic. A variety of different types of foams are available, depending on the composition of the formula and the nature of the application. Many of the foam tips can also be offered in different configurations for specific applications. The plastic ampoule allows the user to activate the package with a gentle squeeze of one hand, rupturing the patented internal membrane. Another gentle squeeze then dispenses the contents onto the applicator tip. The rate and flow of the product is easily controlled by the user.
