

Automatic Crimping Machines

This family of fully automatic crimping machines has grown with the introduction of the CrimpCenter 64 with four processing stations and the CrimpCenter 65 with up to five processing stations. Both machines offer new processing capabilities with various configuration possibilities for crimping, sealing, twisting, and tinning of wires from 30 to 10 AWG. New options further expand the CrimpCenter application range and allow for processing of demanding applications such as thin, short, or long wires; zip cords; closed barrel terminals; or hard jacket seals.
