

Packaging Robot

The Quattro s650 robot is an extremely fast light payload packaging and handling robot. It utilizes a patented 4-link parallel drive and carbon fiber construction to provide packaging cycle times which are twice as fast as conventional packaging robots and up to 240 pick-and-place cycles per minute. The Adept Quattro s650 robot is also the world's first packaging robot to integrate the controls inside the robot, virtually eliminating external controls cabinets, saving valuable factory floor space and simplifying installation.
