

## Laser Marking

The Professional Laser Series is a line of CO<sub>2</sub> laser systems that provides an impressive combination of high power (up to 120 watts using dual lasers), three popular work table sizes, and an advanced, materials-based print driver that delivers consistently good cutting and engraving results. The system delivers permanent metal marking using special optics or a metal marking compound at a fraction of the cost of a comparable YAG marking device. CO<sub>2</sub> laser marking is a non-contact process that eliminates the stress points and deformation produced by most other marking methods—ideal for metals that are subject to hot, wet, abrasive, or corrosive environments.
