

Storage System

This SiliconDrive platform is designed to overcome storage system reliability and compatibility issues associated with faster host system interfaces and shrinking storage component process geometries to deliver the high performance, high reliability, and multi-year product lifecycle storage systems required by OEMs. Future SiliconDrive product families will be based on this next-generation technology platform and will feature enhanced protection from host system voltage and power anomalies to prevent data and drive corruption, a more precise storage system useable-life monitoring system to compensate for lower endurance storage components, and a robust storage management architecture to ensure long product life.
