

Self-Clinching Fasteners (4339)

PEM SpotFast stainless steel self-clinching fasteners ideally suit flush-mount attachment applications where corrosion resistance may be required. These fasteners permanently join two metal sheets to create a flush-attachment connection without protrusions on either side and can serve as practical alternatives for rivets or welding. Their rotational capability extends application potential by enabling a single fastener to act as a hardened pivot point. The fasteners (Type SFP) are made from precipitation hardened stainless steel and can be installed in stainless steel sheets as thin as 0.03 in. with hardness of 88 or less on the Rockwell "B" scale.
