

Digital Delay/Pulse Generator

The Model 575 digital delay / pulse generator combines the properties of a pulse generator with that of a digital delay generator. It is a multi-channel pulse generator and digital delay generator in a single bench top instrument. Two instruments can be side-by-side in a single rack mount. A true pulse generator provides independent control of rate, delay, and width with an external trigger. The 575 is the only multi-channel unit to permit differing rates for all the channels.
