

Injection Press

The G9 Series of injection presses for rubber, TPE, and LSR products has been expanded. The showcase machine in this new generation is the V79, a 550-ton press with advanced design features in the mechanical, electronic, and hydraulic construction aspects. Other standard presses are offered in the 55-900 clamp tonnage range. No pit or operator platform is required on the V79, as the movable traverse is located at operator level. Mold thickness adjustment is automatic and the work height is constant, regardless of mold height.
