

Tantalum Capacitors

A broad range of tantalum capacitors are ideal for embedded control systems. Used in a wide variety of ECU (electronic control units), embedded systems operate in applications where long operation time and stability of parameters are the essential design parameters. Embedded systems are designed to operate continuously for years without failures and to recover automatically if a failure does occur. The TPS and TPM Series provide low ESR and improve the filtering capability and power rating within a small dimension and reduced height.
