

Reflective Memory PMC Increases Data Security

The P512 is a reflective memory PMC that provides real-time redundant memory storage across multiple computers in a networked system. In addition to high transmission speeds and exceptional flexibility, the 32-bit/33 MHz P512 offers increased data security as well as expanded memory capacity, since memory elements can be read from and written to different processors simultaneously and shared among PCs providing a redundant memory architecture. The P512 is widely used in a variety of mission-critical and data-intensive applications.
