

## Offering of Swiss Type Rotary Broaching Tool Holders Doubles

Thirty-eight different Swiss broach holders are available as part of the line of rotary broaching tool holders for CNC, screw and Swiss lathe machines, and milling machines, doubling the current offering. Rotary broaching tools are used to put hex and square shaped holes into metal parts, such as orthopedic bone screws. The increased volume of micro-size parts for medical customers has also increased the interest in micro-broaching operations. The Swiss type tool holders are well suited for applications where the size of the form to be broached is less than 0.05" major diameter. All of the new broaching tools are designed to work with broaches in this size range. Any standard length square broach, hexagon broach, or custom form broach will fit these CNC machine tools.
