

# Pinch Valve Series Has Low Power Requirements

The redesigned, solenoid-operated 075P2 two-way valves have low power requirements and are available with a normally open or normally closed valve function. The design eliminates sharp edges, with smooth contours that allow easier insertion and removal of tubing without snares. An integrated insert provides both positive tube retention and confirmation of correct tubing size. Manual push-button override is available as an option. It features a valve body constructed from Luran and a plunger composed of Ryton. These materials are resistant to most common cleaning solutions and easily meet the company's two million cycle operation standard.
