

Spin Welding Capabilities for Specialized Joining of Plastics to Metals

The Spin Welder allows plastic components to be quickly, cleanly, and permanently attached to metal assemblies. The addition of this machine allows the company to manage complex projects that require both metal manufacturing and plastic attachment, saving both time and money for their customers. Prior to the introduction of this new capability, the company would construct complex metal components, then outsource these to outside vendors for the assembly of the plastic portion. Plastics vendors, unfamiliar with medical device development, can include unnecessary features in their parts. The Spin Welder allows the integration of the manufacture of components entirely in-house.
