

Interface Adapter Provides Jumpflex Signal Conditioners and Relays

WAGO Corp.'s interface adapter provides Jumpflex signal conditioners and relays with a tool-free interface to the WAGO-I/O-system or other PLC interfaces. Interface adapters capture analog/digital signals for eight combined Jumpflex modules, ideal for machines requiring large amounts of input/output signals. Ribbon cable and D-Sub connector models provide eight-channel connectivity; other interface products connect the interface adapters to WAGO's 16-channel digital I/O modules.

Jumpflex interface adapters streamline commissioning and eliminate wiring errors for both field and control levels. To simplify troubleshooting, each interface adapter features marking tag holders and a test location at each channel. Integrated indicators for signal and/or power status are also included. Complementary products include DIN-rail mount interface boards and relay modules.
