

## Triple Element Bench Infrared Heat Tool

Eraser's Triple Element Bench Glo-Ring® Infrared Heat Tool is ideal for many applications including heat shrinking, plastic tube bending, soldering, adhesive curing, solder preforms, butt welding and more. The unit uses encapsulated, Quartz heating elements which open and close (initiated either by a hand or foot switch) to encircle work pieces providing instant radiant heat at temperatures up to 1500°F (815°C). Heating elements are interchangeable, available in four different sizes and are protected by wire guards for safety. One, two, or all three element holders may be utilized at any time. The unit incorporates solid state heat controls for shrinking long lengths of heat shrink tubing. No R.F. interference is generated with the unit, thus it is suitable for use in clean rooms and testing areas. Eraser's Triple Element Bench Glo-Ring® Infrared Heat Tool is an excellent alternative to a heat gun because it uses less electrical energy, does not blow hot air, and is simple to maintain.
