

Custom Laser Job Shop Services

The stent material, cutting techniques, finishing techniques, and inspection techniques are integral to a quality medical stent. Careful customization is required with these processes to meet specific medical requirements. All stents need flexibility to travel through the vascular system, compliant for deployment and to provide support for various vessel anatomies, and compatible in order to be implanted and invisible to the body. Early collaboration with Laserage, a precision contract manufacturer will result in vital input during the design stages of the stent development. Laserage has been making laser stents for over 15 years. Our focus is on excellence.
