

Input/Output Panel Meter Reads Transducers

MDT Staff

The Ashcroft Model DM61 digital panel meter does more than just display the analog or Modbus RTU digital signal from a sensing device with an output. Equipped with a variety of electronic features, this input-output device allows the user to configure the display to readout in their required engineering unit, recall min & max readings and set hi-lo alarms. Standard features also include a six digit display, password protection and an on-board DC transducer power supply. Also available are internal or external relays, a 4-20mA output and expansion modules to enable conversion to USB and other serial outputs.
