

# Torque Inserts Deliver Ideal Pivoting Capabilities

MDT Staff

Reell torque inserts have introduced a new category of torque control hinges delivering exceptional pivoting capabilities without the standard appearance of conventional hinges. Depending on model, the torque inserts uniquely press-fit into a variety of materials via a keyed cavity or can be plastic over-molded. Their elimination of hardware for installation contributes to savings in time and costs and ultimately promotes enhanced cosmetics for assemblies.

The torque inserts additionally benefit from patented ReellTorq clip technology, which eliminates any need for adjustment and imparts a premium quality feel, smooth and precise position control, and consistent torque over their service life. The TI-100 Series features a glass-filled nylon package configuration with 360° of rotation. These can be pressed into keyed cavities in a variety of die cast or extruded metals or molded plastics and will provide equal torque in both directions.
