

Biodegradable Hand Held Enclosures

MDT Staff

OKWs SOFT-CASE series of hand held enclosures is now available from stock molded in BIOGRADE bioplastic material. For most applications this bioplastic material can be used instead of the fossil plastics, such as ABS, which were used until now.

BIOGRADE is a CO₂ neutral material, technically compostable and biodegradable, and has similar mechanical and physical properties to ABS. On demand, OKW can also mold many of its other enclosure lines in this material. As a result, design engineers can now ensure the green credentials of their electronics by using these off-the-shelf biodegradable housings.
